

Annual Drinking Water Quality Report for 2018
Golden Kay Apartments
May, 2019
PWSID 0070202

We're pleased to present to you this year's Annual Water Quality Report. This report is designed to inform you about the water quality and services we deliver to you every day. Our constant goal is to provide you with a safe and dependable supply of drinking water. We want you to understand the efforts we make to continually improve the water treatment process and protect our water resources. We are committed to ensuring the quality of your water.

Our water source is one active well which draws from an underground source known as an Aquifer. The depth of our well is approximately 92 feet.

We have a source water protection plan available that provides more information such as potential sources of contamination. This plan is available at the Cecil County Public Library or from Maryland Department of the Environment (MDE).

This report shows our water quality and what it means.

Some people may be more vulnerable to contaminants in drinking water than the general population. Immuno-compromised persons such as persons with cancer undergoing chemotherapy, persons who have undergone organ transplants, people with HIV/AIDS or other immune system disorders, some elderly, and infants can be particularly at risk from infections. These people should seek advice about drinking water from their health care providers. EPA/CDC guidelines on appropriate means to lessen the risk of infection by cryptosporidium and other microbiological contaminants are available from the Safe Drinking Water Hotline (800-426-4791).

If you have any questions about this report or concerning your water, please contact our office at (410) 398-6942. We want our residents to be informed about their water.

Golden Kay Apartments routinely monitors for contaminants in your drinking water according to Federal and State laws. The following table shows the results of our monitoring for the period of January 1st to December 31st, 2018, or as otherwise indicated. As water travels over the land or underground, it can pick up substances or contaminants such as microbes, inorganic and organic chemicals, and radioactive substances. All drinking water, including bottled drinking water, may be reasonably expected to contain at least small amounts of some constituents. It's important to remember that the presence of these contaminants does not necessarily pose a health risk.

In this table you will find many terms and abbreviations you might not be familiar with. To help you better understand these terms we've provided the following definitions:

Parts per million (ppm) or Milligrams per liter (mg/l) - one part per million corresponds to one minute in two years or a single penny in \$10,000.

Parts per billion (ppb) or Micrograms per liter - one part per billion corresponds to one minute in 2,000 years, or a single penny in \$10,000,000.

Picocuries per liter (pCi/L) - picocuries per liter is a measure of the radioactivity in water.

Action Level - the concentration of a contaminant which, if exceeded, triggers treatment or other requirements which a water system must follow.

Maximum Contaminant Level - The "Maximum Allowed" (MCL) is the highest level of a contaminant that is allowed in drinking water. MCLs are set as close to the MCLGs as feasible using the best available treatment technology.

Maximum Contaminant Level Goal - The "Goal"(MCLG) is the level of a contaminant in drinking water below which there is no known or expected risk to health. MCLGs allow for a margin of safety.

| TEST RESULTS | | | | | | |
|---|---------------|---------------------|------------------|------|--------|--|
| Contaminant | Violation Y/N | Level Detected | Unit Measurement | MCLG | MCL | Likely Source of Contamination |
| Radioactive Contaminants | | | | | | |
| Beta/photon emitters, Range (2018) | N | 7 | pCi/l | 0 | 50 | Decay of natural and man-made deposits |
| Alpha emitters, Range (2018) Annual Running Average | N | 2.8 – 9.7 12 | pCi/l | 0 | 15 | Erosion of natural deposits |
| Combined radium (226 & 228) Range (2018) Annual Running Average | Y | 0 – 6.9 6 | pCi/l | 0 | 5 | Erosion of natural deposits |
| Inorganic Contaminants | | | | | | |
| Nitrate (as Nitrogen) (2018) | N | 3 | ppm | 10 | 10 | Runoff from fertilizer use; leaching from septic tanks, sewage; erosion of natural deposits |
| Copper (2018) (Distribution) | N | 0.03 | ppm | 1.3 | AL=1.3 | Corrosion of household plumbing systems; erosion of natural deposits; leaching from wood preservatives |
| Lead (2018) (Distribution) | N | 2 | ppb | 0 | AL=15 | Corrosion of household plumbing systems, erosion of natural deposits |

Note: Test results are for year 2018 unless noted otherwise; testing for all contaminants is not required annually.

If present, elevated levels of lead can cause serious health problems, especially for pregnant women and young children. Lead in drinking water is primarily from materials and components associated with service lines and home plumbing. Golden Kay Apartments is responsible for providing high quality drinking water, but cannot control the variety of materials used in plumbing components. When your water has been sitting for several hours, you can minimize the potential for lead exposure by flushing your tap for 30 seconds to 2 minutes before using water for drinking or cooking. If you are concerned about lead in your drinking water, you may wish to have your water tested. Information on lead in drinking water, testing methods, and steps you can take to minimize exposure is available from the EPA Safe Drinking Water Hotline at 1-800-426-4791 or at <http://www.epa.gov/safewater/lead>.

Combined Radium 226/228. Some people who drink water containing radium 226 or 228 in excess of the MCL over many years may have an increased risk of getting cancer.

Violations

Combine Radium 226/228

Our system was in violation of the MCL for Combined Radium 226/228 during the first quarter of 2018. We take quarterly samples for Combined Radium 226/228; compliance with the MCL is calculated each quarter based on the running annual average of the most recent four sets of results. We returned to compliance in the second quarter of 2018.

Lead and Copper Rule

We were originally required to sample for lead and copper in 2017 but did not sample until 2018. We were returned to compliance for this monitoring violation when we submitted results to MDE on October 30, 2018.

All sources of drinking water are subject to potential contamination by substances that are naturally occurring or man made. These substances can be microbes, inorganic or organic chemicals and radioactive substances. All drinking water, including bottled water, may reasonably be expected to contain at least small amounts of some contaminants. The presence of contaminants does not necessarily indicate that the water poses a health risk. More information about contaminants and potential health effects can be obtained by calling the Environmental Protection Agency's Safe Drinking Water Hotline at 1-800-426-4791.

MCLs are set at very stringent levels. To understand the possible health effects described for many regulated constituents, a person would have to drink 2 liters of water every day at the MCL level for a lifetime to have a one-in-a-million chance of having the described health effect.

Please call our office at 410-398-6942 if you have questions about this report.
